

# OpenCode Skills Cheat Sheet — Installed from davidondrej/skills

| Skill                               | Type   | Trigger / How to Invoke                                                                                     | What It Does                                                                                                        |
|-------------------------------------|--------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>effective-agent-skills</b>       | Auto   | Say: "create a skill", "new skill", "update this skill", "improve a skill", "why isn't my skill triggering" | The definitive guide on writing agent skills (anatomy, design patterns, anti-patterns, testing, security checklist) |
| <b>handoff</b>                      | Manual | handoff — invoke explicitly when hitting context limits or ending a session                                 | Compacts the conversation into a structured handoff document so a fresh agent can continue without losing context   |
| <b>short</b>                        | Manual | short — or say "short", "shorter", "simpler", "too long", "tl;dr"                                           | Forces agent to compress its last response — strip filler, simplify wording                                         |
| <b>copywriting</b>                  | Auto   | Triggers when writing any user-facing copy (tweets, READMEs, emails, bios, announcements)                   | Writing style guide: short sentences, no emojis, minimum hype, authentic vs formal modes, anti-AI-tells             |
| <b>brain-to-docs</b>                | Auto   | Say: "brain-to-docs", "build out the docs", "extract the vision", "let's document this project"             | Extracts project vision/decisions from your head into README + ADRs via back-and-forth Q&A                          |
| <b>teach</b>                        | Manual | teach <topic> — or say "teach me X"                                                                         | Full interactive teaching system with lessons (HTML), references, learning records, spaced repetition               |
| <b>interview-style-doc-building</b> | Auto   | Say: "let's build a doc", "create a priorities doc", "walk me through this document"                        | Builds structured strategic docs by asking one question at a time, patching the file after each answer              |

## Trigger Types Explained

- **Auto** — skill activates automatically when your request matches its description. Just talk naturally.
- **Manual** — skill has `disable-model-invocation: true`. You need to explicitly invoke it (say its name or the trigger phrase) for it to load.

## Quick Reference: Manual Invocation

|                   |                                      |
|-------------------|--------------------------------------|
| "handoff"         | → Generate session handoff           |
| "short" / "tl;dr" | → Compress last response             |
| "teach me Python" | → Start interactive teaching session |
